# Outline

1. **Overview:** otitis
2. **Database and Task:**  PEDIA.NET
3. **Programming paradigms:** classical and machine learning
4. **Classical text classification** search string and regular expression
5. **Shallow machine learning:** document-text matrix
6. **Neural networks:** basics
7. **Embeddings:** dense representation of text
8. **Deep networks:** convolutions, sequential/recurrent
9. **Task & metrics:** multi-class, scores and human-performances
10. **Analyses plan:** flowchart
11. **Our approach:** architectures explored
12. **Results, final remarks and conclusions**

# Overview classification of otitis

- one of the most common infections in pediatrics
- the main cause of antibiotic prescriptions
- challenging diagnosis
- frequently, little attention is paid to the guidelines
- continuing interest in defining the incidence and burden of AOM

[https://commons.wikimedia.org/wiki/File:Otitis\\_Media.png](https://commons.wikimedia.org/wiki/File:Otitis_Media.png)

# Database and Task

A. Kao, S. Poteet (2007) **Text Mining: the discovery and the extraction of interesting, non-trivial knowledge from free or unstructured text.**

**snapshot considerd:** from 1st January 2004 to 23rd August 2017

**records:** 6, 903, 035 (297, 373 filtered by a search string )

**pediatricians:** 144 (troughout Italy)

**children:** 216, 976

**fields** (all free-text, Italian-language):

- diagnosis
- signs-and-symptoms
- diary
- prescription
- visit description
- visit result

# 2019 investigation

- data from 2010 to 2015
- **on primary diagnosis only**

Adding even the diaries in a traditional manual human-driven analysis proved to be **too costly** in terms both of person-time and economic resources

It is necessary to develop an **accurate** system able to classify all the  records **automatically** investigating **all the textual fields** in the database.

## Antibiotic prescriptions in acute otitis media and pharyngitis in Italian pediatric outpatients

### Abstract

#### Background

Acute otitis media (AOM) and pharyngitis are very common infections in children and adolescents. Italy is one of the European countries with the highest rate of antibiotic prescriptions. The aim of this study is to describe first-line treatment approaches for AOM and pharyngitis in primary care settings in Italy over six years, including the prevalence of "wait and see" for AOM, where prescription of antibiotics is delayed 48 h from presentation, and differences in prescribing for pharyngitis when diagnostic tests are used.

#### Methods

The study is a secondary data analysis using Pedianet, a database including data at outpatient level from children aged 0–14 in Italy. Prescriptions per antibiotic group, per age group and per calendar year were described as percentages. "Wait and see" approach rate was described for AOM and pharyngitis prescriptions were further grouped according to the diagnostic test performed and test results.

#### Results

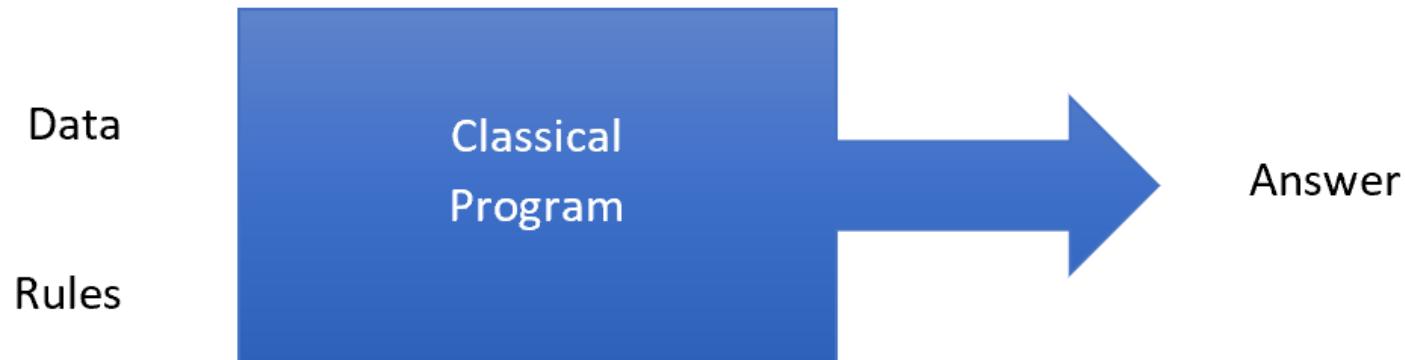

We identified 120,338 children followed by 125 family pediatricians between January 2010 and December 2015 for a total of 923,780 person-years of follow-up. Among them 30,394 (mean age 44 months) had at least one AOM diagnosis ( $n = 54,943$ ) and 52,341 (mean age 5 years) had at least one pharyngitis diagnosis ( $n = 126,098$ ). 82.5% of AOM diagnoses were treated with an antibiotic within 48 h (mainly amoxicillin and amoxicillin/clavulanate) and the "wait and see" approach was adopted only in 17.5% of cases. The trend over time shows an increase in broad spectrum antibiotic prescriptions in the last year (2015). 79,620 (63%) cases of pharyngitis were treated and among GABHS pharyngitis confirmed by rapid test 56% were treated with amoxicillin. The ones not test confirmed were treated mainly with broad spectrum antibiotics.

#### Conclusions

Despite guidance to use the "wait and see" approach in the age group analyzed, this strategy is not often used for AOM, as previously noted in other studies in hospital settings. Broad-spectrum antibiotic prescription was more frequent when pharyngitis was not confirmed by rapid test, in keeping with evidence from other studies that diagnostic uncertainty leads to overuse of antibiotics.

# Programming paradigms classical and machine learning

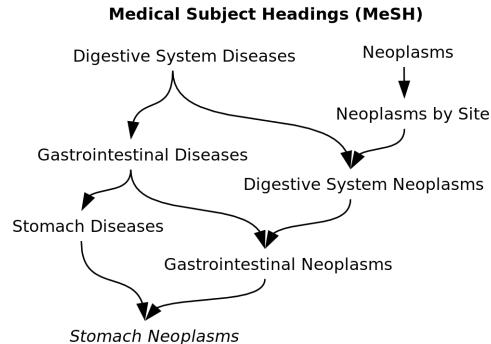

Arthur Samuel (1959). **Machine Learning**: Field of study that gives computers the ability to learn without being explicitly programmed.

# Classical text classification

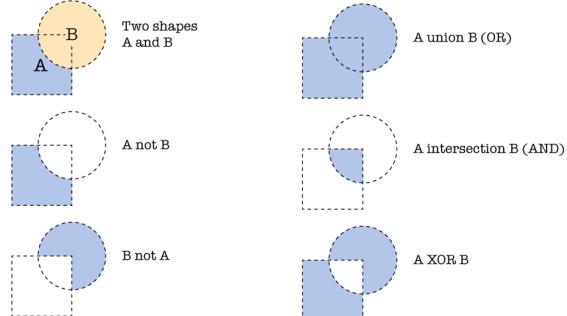

## Search string and regular expression

# Search string

One or several strings (also called patterns) founded within a larger string or text.

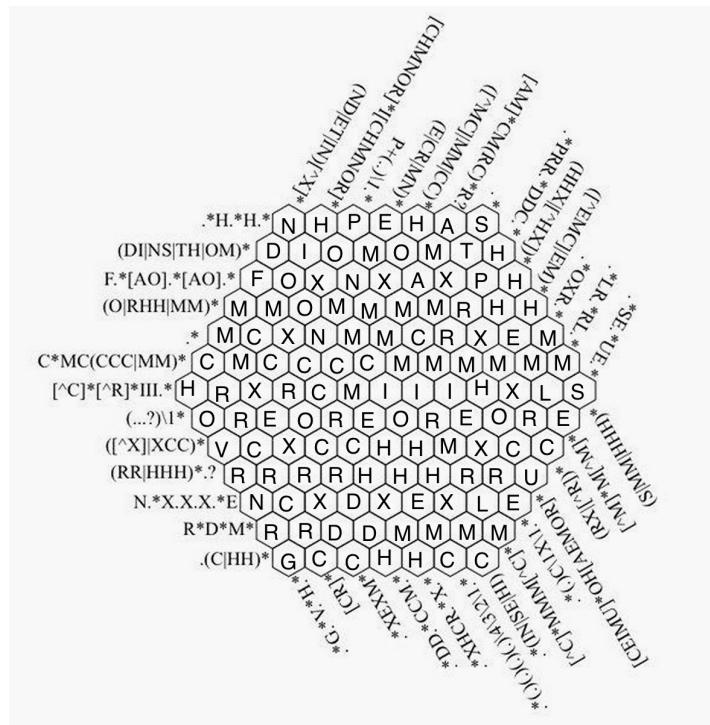

<https://upload.wikimedia.org/wikipedia/commons/thumb/8/85/MeSH-example.svg/1024px-MeSH-example.svg.png>

[https://it.wikipedia.org/wiki/File:Boolean\\_operations\\_on\\_shapes.png](https://it.wikipedia.org/wiki/File:Boolean_operations_on_shapes.png)

# Regular expressions

A sequence of characters that define a search pattern

<https://www.flickr.com/photos/bluesmoon/8458343489/in/photostream/>

# Shallow machine learning document-text matrix

# Preprocessing

- **removing** (removes noise):
  - remove non-word text
  - remove stopwords
  - strip whitespace
- **merging** (reduce the risk to allow important information to become noise because they are dispersed):
  - lowering
  - stemming
  - lemmatization
- **producing** (from words to “tokens”, i.e. single indivisible piece of information to bring information which could be lost otherwise, e.g. negations):
  - n-Grams (consecutive sequences of n words)

## Regression

1. The system attempts to predict a value for an input based on past data.
2. Real number / Continuous numbers – Regression problem
3. Example – 1. Temperature for tomorrow

## Classification

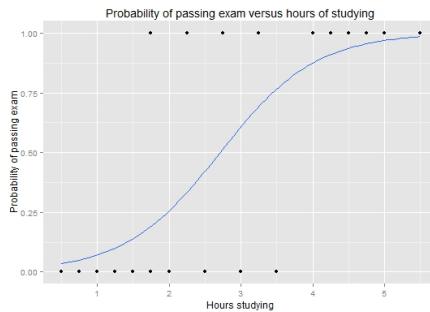

1. In classification, predictions are made by classifying them into different categories.
2. Discrete / categorical variable – Classification problem
3. Example – 1. Type of cancer 2. Cancer Y/N

# Task multi-class classification

Based on data provided in the EHRs at the visit level, decide if it reports:

0. whatever other than an otitis case
1. an otitis case which is not media (whatever severity)
2. a media otitis which is not acute

3. an AOM (w/o tympanic membrane perforation, nor recurrent)

4. an AOM with tympanic membrane perforation

5. a recurrent AOM

# Metrics scores and human-performances

Gold-standard definition:

- two independent expert annotators (weighted Cohen's Kappa = 0.89)
- one pediatrician specialized in infectious diseases decided where the experts shown disagreement:\*

Expert annotators	Accuracy [%]	Balanced F1 [%]
A	95.91	93.47
B	95.80	90.12

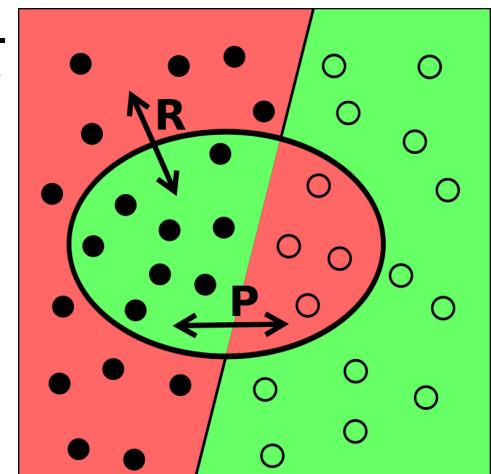

$$\text{Accuracy} = \frac{|\text{true classified}|}{|\text{records}|}$$

\*Performances reported for the test set.

$$\text{Balanced F1} = \frac{\text{balanced precision} \cdot \text{balanced recall}}{\text{balanced precision} + \text{balanced recall}}$$

$$\text{Balanced precision} = \frac{\sum_{i \in \text{classes}} \frac{|\text{true classified as } i|}{|\text{labelled as } i|}}{|\text{classes}|}$$

$$\text{Balanced recall} = \frac{\sum_{i \in \text{classes}} \frac{|\text{true classified as } i|}{|\text{class } i|}}{|\text{classes}|}$$

# Deep-learning approach architecture explored

# Results

Network	Balanced precision	Balanced recall	Accuracy	Balanced F1
Simple Embedding	84.51	68.63	81.70	75.75
Single Kernel	92.60	91.87	94.66	92.23
Sequential CNN	95.94	81.26	93.64	87.99
Parallel CNN	96.95	94.78	96.59	95.86
Deep CNN	96.38	93.36	96.25	94.85
Ensemble (w/o Simple Embeddings)	97.03	93.97	96.59	95.47

\* **Bold face** = over the maximum  
 \* *italic* = over the mean

Annotators	Balanced precision	Balanced recall	Accuracy	Balanced F1
A	91.70	95.30	95.91	93.47
B	96.33	84.66	95.80	90.12
(mean)	(94.02)	(89.98)	(95.86)	(91.80)

# Final remarks

# Strengths

- embedding: no more needs to hand-craft features
- deep learning:
  - automatical detection and modeling of non linearities and interactions
  - update models w/ new data
  - use pre-trained or merge multiple models
  - can take advantage of more data than shallow models

# Weakness

- our human-performance estimation is not based at the professional levels
- missing of computational power (i.e, GPUs) for deeper networks, e.g., recurrent

# Possible improvement

- improve the gold standard:
  - quality (human-performance level)
  - accuracy (error analyses)
  - quantity (more training records / active learning)
- deeper networks / advanced architectures
- different weighting schemes for the ensamble

# Conclusions

# Deep Learning Approach to Text-Mining EHR

- Can be used to identifying and classifying diagnosis from (huge amount of) free text
- Quality comparable with human-performances
- Trained models can be adopted on other health care databases, different from the original one
- It can improve healthcare research limiting human errors and time, speeding up databases interrogations

Thank you  
for the attention
